SpanCanvas Pro

Your display setup, measured.

A practical worksheet for planning one picture across multiple displays. Fill it in digitally or print it. No email or account is required.

1. Measure the visible image area, not the bezel or advertised diagonal. Use millimeters (10 mm = 1 cm). Measure each screen in its current orientation.

2. Note which edges line up on your desk. Measure the physical space between visible image edges, including both bezels.

3. Keep measurements separate from pixels. macOS resolution/scaling changes text and object size; physical screen size is a different measurement.

Your displays

Display / position	Width (mm)	Height (mm)	Portrait / landscape

The space between

Between which displays?	Horizontal gap (mm)	Vertical gap (mm)

Alignment notes

For example: left screen is portrait; bottom edges align; upper display is centered.

4. Check your layout with a grid or a subject that crosses screen edges. Recheck after moving, rotating or reconnecting a display. Keep important faces or text out of hidden gaps.

Planning aid only. Not a promise of automatic window scaling or supported app features.
